<p>(54) Title: DISPLACEMENT AND/OR ANGLE SENSOR COMPRISING A MEANDERING MEASURING WINDING</p> <p>(54) Bezeichnung: WEG- UND/ODER WINKELAUFNEMER MIT MÄANDERFÖRMIGER MESSWICKLUNG</p>		
<p>(57) Abstract</p> <p>The invention relates to an inductive measured value sensor for determining the position of a body which can be displaced with regard to a stationary housing. The inventive sensor is characterized in that the displaceable body has an inductive transmission element which generates a magnetic alternating field extending over a limited area. In addition, this alternating field entirely or partially permeates at least one conductor loop which extends over the measuring length and which is connected to the housing. Said conductor loop comprises a feed line along the measuring path, and the return line thereof is configured in such a way that it is alternatively guided in regular intervals such that it is either permeated only slightly by the alternating field of the transmission element or is permeated by a predominate portion of the alternating field, and such that the areas with a high alternating field permeation have a width that is proportional to the expected output value associated with the desired position value, and the output voltage thereof is conducted to an output.</p>
